

**Amended Claims due to the 1st OA**

Claim 1 (currently amended): A pressure regulator for connecting a pressure source to an inflatable object, comprising:

- a hollow casing having a fluid inlet end, a fluid outlet end, and a side wall;
- a valve system positioned inside the hollow casing;
- a fluid inlet connected to the valve system, the inlet located at the fluid inlet end of the hollow casing and adaptable for connection to a pressure source;
- a fluid outlet located at the fluid outlet end of the hollow casing, the outlet adaptable for connection to an inflatable object;
- a fluid conduit positioned inside the hollow casing between the fluid inlet and the fluid outlet;
- a pressure-sensing structure attached to the conduit, the pressure-sensing structure movable inside the hollow casing in the longitudinal direction; and
- a pressure-generating structure disposed inside the hollow casing and attached to the pressure-sensing structure, the pressure-generating structure capable of exerting a bias force upon the pressure-sensing structure in proportion to a desired pressure in the inflatable object,

wherein the valve system is actuated by the conduit which moves longitudinally with the pressure-sensing structure in response to the pressure differential between the two sides of the pressure-sensing structure, capable of preventing the force produced by the pressure source from transferring to the pressure-sensing structure when the valve system is in close state;

wherein the pressure regulator is capable of inflating the object when the initial pressure inside the inflatable object is lower than the desired pressure, and the pressure regulator is capable of automatically terminating inflation when the pressure inside the object reaches the desired pressure.

Claim 2 (original): The pressure regulator of claim 1, wherein the pressure regulator is capable of deflating the object when the initial pressure inside the inflatable object is higher than the desired pressure, and the pressure regulator is

capable of automatically terminating deflation when the pressure inside the object reaches the desired pressure.

Claim 3 (original): The pressure regulator of claim 1, wherein the pressure-sensing structure is a piston.

Claim 4 (original): The pressure regulator of claim 3, wherein the piston is of a lip type.

Claim 5 (original): The pressure regulator of claim 3, wherein the piston is an O-ring piston.

Claim 6 (original): The pressure regulator of claim 1, wherein the pressure-generating structure is a coil spring disposed between the pressure-sensing structure and a spring collar.

Claim 7 (original): The pressure regulator of claim 6, wherein the side wall of the hollow casing includes a port between the pressure-sensing structure and the spring collar, and the port is capable of releasing fluid from the inflatable object when the pressure inside the object exceeds the desired pressure.

Claim 8 (original): The pressure regulator of claim 7, wherein the distance between the port and the pressure-sensing structure is proportional to the maximum pressure allowed for the inflatable object.

Claim 9 (original): The pressure regulator of claim 1, wherein the valve system is a Shrader valve.

Claim 10 (original): The pressure regulator of claim 1, wherein the valve system is a ball valve.

Claim 11 (canceled and added to claim 1)

Claim 12 (original): The pressure regulator of claim 1, further includes a reed disposed in the fluid flow path.

Claim 13 (original): The pressure regulator of claim 12, wherein the reed comprises two sound-generating pieces; the first piece generates a buzzing sound during inflation; and the second piece generates a different buzzing sound during deflation.

Claim 14 (original): The pressure regulator of claim 6, wherein the spring collar is connected to at least one screw which extends outside the side wall of the hollow casing.

Claim 15 (original): The pressure regulator of claim 14, wherein the setting for the desired pressure is adjusted by sliding the screw along a longitudinal slot formed in the side wall of the hollow casing.

Claim 16 (original): The pressure regulator of claim 14, wherein a bellows is disposed between the spring collar and the fluid outlet.

Claim 17 (original): The pressure regulator of claim 1, further includes a component for presetting the desired pressure in the inflatable object.

Claim 18 (original): The pressure regulator of claim 1, further includes a pressure indicator disposed in the hollow casing.

Claim 19 (original): The pressure regulator of claim 18, wherein the pressure indicator is a marker.

Claim 20 (original): The pressure regulator of claim 19, wherein the maker is attached to the outside of the conduit.

Claim 21 (original): The pressure regulator of claim 1, further comprising a flow indicator.

Claim 22 (original): The pressure regulator of claim 21, wherein the flow indicator is a visual ball display.

Claim 23 (canceled)

Claim 24 (currently amended): A product made according to ~~any of the preceding claims~~ claim 1.

Claim 25 (original): The product of claim 24, wherein the product is a tire valve.

Claim 26 (original): The product of claim 24, wherein the product is a tire valve extension.

Claim 27 (original): The product of claim 24, wherein the product is a flow control device.

Claim 28 (original): The product of claim 24, wherein the product is a tire inflating or deflating device.

Claim 29 (currently amended): A method of inflating or deflating an inflatable object comprising using the pressure regulator according to ~~any of claims 1-23~~ claim 1.

Claim 30 (currently amended): A method of inflating or deflating an inflatable object, comprising:

obtaining a pressure regulator comprising a pressure-sensing structure, a pressure-generating structure, a fluid conduit, and a valve system inside a hollow casing, the valve system capable of actuating fluid flow to the fluid conduit according to the difference between a desired pressure and the actual pressure inside the inflatable object, and capable of preventing the force produced by the pressure source from transferring to the pressure-sensing structure when the valve system is in close state;

presetting the desired pressure on the regulator to cause the pressure-generating structure to exert a bias force on the pressure-sensing structure;

connecting the pressure regulator to a pressure source and the inflatable object;

effectuating fluid flow from the pressure source to the inflatable object through the fluid conduit if the desired pressure is higher than the initial pressure in the inflatable object; and

effectuating fluid release from the inflatable object ~~and through the fluid conduit~~ if the desired pressure is lower than the initial pressure in the inflatable object,

~~wherein the valve system does not permit fluid flow from the pressure source to the inflatable object when the desired pressure is lower than the actual pressure.~~
